Corporate Blueprint Cohort 1 Data Analysis Report

Executive Summary

This report presents the findings from the analysis of the Corporate Blueprint Cohort 1 assessment data. The objective of the analysis was to evaluate learner participation, assess overall academic performance, identify trends across different assessments, and provide recommendations that can help improve future cohorts.

The dataset was first cleaned by removing inconsistencies, correcting text formatting, verifying calculations, and organizing the data into a structured format. Exploratory Data Analysis (EDA) was then carried out using Google Sheets, followed by the development of an interactive dashboard to visualize key performance indicators and learner outcomes.

Key Findings

The analysis revealed that the cohort consisted of **34 learners**.

Most learners were classified under the **Needs Improvement** performance category, indicating that many participants struggled to achieve satisfactory scores across the assessments. Only a few learners were categorized as **Good** or **Fair**, while no learner reached the **Excellent** category.

Among all assessments, the **Classroom Discussion Board** recorded the highest average score, showing that learners performed relatively better in collaborative classroom activities. On the other hand, the **Capstone Assessment** and **Personal Time Management Improvement Plan** recorded the lowest average scores, suggesting that these assessments were either not completed by learners or had very low participation.

The analysis also showed that no learner achieved an overall average score above 70%, highlighting a generally low level of performance across the cohort.

Charts and Visualizations

The following visualizations were developed to support the analysis:

- Bar Chart showing the average score for each assessment.

- Pie Chart illustrating the distribution of learner performance categories.

- Column Chart comparing the total scores of individual learners.

- Histogram displaying the distribution of learners' average scores.

- Performance Distribution Chart showing the number of learners in each performance category.

These visualizations made it easier to identify performance patterns and compare learner outcomes across different assessments.

Performance Trends

Several important trends were observed during the analysis.

Learners generally performed better in assessment activities that required classroom participation, while assessments requiring independent completion recorded significantly lower scores.

The large number of learners in the **Needs Improvement** category suggests that many participants either struggled academically or did not complete all required assessments.

The absence of learners in the **Excellent** category indicates an opportunity for improvements in learner engagement, academic support, and assessment completion.

Overall, learner performance remained below the expected standard, with incomplete assessments having a noticeable impact on overall results.

Challenges Identified

During the analysis, several challenges were identified:

- Many learners did not complete all the required assessments.
- Some assessment columns contained zero scores, making it difficult to evaluate actual learner performance.
- Low participation reduced the overall average scores of the cohort.
- The dataset required cleaning before meaningful analysis could be carried out.
- Incomplete assessment records affected the accuracy of performance comparisons.

Recommendations

The following recommendations are suggested for future Corporate Blueprint cohorts:

1. Encourage learners to complete all required assessments before the programme closes.
2. Provide regular reminders and progress tracking to improve assessment completion rates.
3. Offer additional academic support and mentoring to learners who are struggling.
4. Review assessment delivery methods to improve learner participation, especially for assessments with very low completion rates.
5. Continue using dashboards and performance reports to monitor learner progress throughout the programme rather than waiting until the end of the cohort.

Conclusion

The analysis provided valuable insights into learner performance within the Corporate Blueprint Cohort 1 programme. Although the overall performance was below expectations, the findings highlight clear opportunities for improvement. By increasing learner engagement, improving assessment completion rates, and providing timely academic support, future cohorts can achieve better learning outcomes.
