### **Exploratory Data Analysis Report**

An exploratory data analysis (EDA) was carried out on the cleaned Corporate Blueprint Cohort 1 dataset to understand learner performance across the different assessments.

The analysis revealed that none of the learners completed all the required assessments, resulting in a 0% completion rate. This suggests that many learners either missed one or more assessments or had incomplete submissions.

The performance category analysis showed that **27 learners** were classified as **Needs Improvement**, **4 learners** achieved a **Good** rating, and **3 learners** were classified as **Fair**. No learner reached the **Excellent** category.

Overall, none of the learners achieved an average score above 70%. The findings indicate low participation and incomplete assessment submissions, which had a significant impact on overall learner performance.

These results highlight the need to improve learner participation, encourage timely completion of assessments, and provide additional academic support to help improve future cohort outcomes.
